## Protein Synthesis Simulation Lab

## Part 1: Introduction

DNA is a very long, thin molecule located in the nucleus. The DNA in one chromosome has 10s of millions of base pairs and hundreds or thousands of genes. Yet an individual cell will only use a small portion of those genes in its lifetime.

Another peculiar thing about DNA is that it is located inside the nucleus, and pretty much stays inside the nucleus, yet the proteins that DNA helps to make are produced OUTSIDE of the nucleus. So how does the cell solve this problem? It sends a "messenger" from the nucleus to the ribosomes in the cytoplasm.

In a process called transcription, the DNA code is transcribed (copied) into mRNA, following rules similar to DNA replication we saw earlier (see below). mRNA moves out of the nucleus into the cytoplasm where it links up with ribosomes in a process called translation and begins churning out proteins.

In DNA code, a "word" is always 3 letters long and is called a "codon." Consider the following DNA segment:

| A | T | C | G | T | C | C | A | A |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| T | A | G | C | A | G | G | T | T | T |

"ATC" is a codon. "GTC" is a codon. "CAA" is a codon. Etc.
In transcription, the DNA code is transcribed (copied) into RNA code, following rules similar to DNA replication we saw earlier EXCEPT that:

| Matches with <br> A.................U | 1. Transcribe the following DNA sequence into mRNA. Draw a line separating each codon: |
| :---: | :---: |
| T............... ${ }^{\text {a }}$ | $\begin{array}{ccccccccccl}\text { A } & \mathrm{T} & \mathrm{C} & \mathrm{G} & \mathrm{T} & \mathrm{C} & \mathrm{C} & \mathrm{A} & \mathrm{A} & \mathrm{A} \ldots .\end{array}$ |
| C...............G |  |
| G...............C |  |

Activity: There are 4 letters of the mRNA code: U-A-C-G. How many possible combinations are there? In other words, how many "words" can you make with those 4 letters if any combination of letters is possible but all "words" are only 3 letters long? Hint - start with a single letter, how many codons can be produced that start with, for example, the letter "A?" You can infer the rest. I'll get you started..

AAA
AAC

## Part 2: Questions

1. At this point, you should have figured out that there are ___ possible codons using 4 letters with 3 letters per codon in any order. However, there are only 20 amino acids, and each codon "codes" for one amino acid - so what does this mean?

Use the codon chart on page 307:
2. What does UAC code for?
7. List the codons for Valine:
3. CAG? $\qquad$
4. AGG? $\qquad$
5. GAU? $\qquad$
6. UUU? $\qquad$
9. Methionine is a "Start" signal. What is its codon?
8. Stop? $\qquad$ ?
$\qquad$
Each amino acid is matched with one or more 3-letter "words." The words are analogous to an amino acid. When the words are put together they make a sentence. The sentence is analogous to a protein. So, let's break the following code.
10. Given the following DNA code, how would this segment be transcribed into mRNA?

T A C C C G A T A C T C C C T T C A A T T
11. Give the 3-letter abbreviation (see p. 4) for the amino acids coded for in that sequence:
12. What is the silly little sentence that this codes for (see p. 4)?

Name $\qquad$
Amino Acid - English word Table

| MET | GLY | ALA | VAL | ILE |
| :---: | :---: | :---: | :---: | :---: |
| START | THE | SAD | RAT | MET |
| PHE | HIS | TRP | PRO | SER |
| RAN | OLD | FOE | SLY | CAT |
| THR | GLU | CYS | ARG | TYR |
| WHO | SAW | MAD | ATE | DOG |
| ASN | GLN | ASP | LEU | LYS |
| AND | HIS | FOR | DAY | BIG |
|  |  |  |  |  |
|  |  | STOP |  |  |

Period $\qquad$ Date $\qquad$
Abbreviation Table

| NAME | CODE |
| :--- | :--- |
| Alanine | ALA |
| Cysteine | CYS |
| Aspartic Acid | ASP |
| Glutamic Acid | GLU |
| Phenylalanine | PHE |
| Glycine | GLY |
| Histidine | HIS |
| Isoleucine | ILE |
| Lysine | LYS |
| Leucine | LEU |
| Methionine | MET |
| Asparagine | ASN |
| Proline | PRO |
| Glutamine | GLN |
| Arginine | ARG |
| Serine | SER |
| Threonine | THR |
| Valine | VAL |
| Tryptophan | TRP |
| Tyrosine | TYR |

In the remaining space, create your own messages (BE APPROPRIATE!) and, working backwards, determine what the DNA sequence would be:

Your message: $\qquad$
Amino acid (3 letter): $\qquad$
mRNA sequence: $\qquad$
DNA Sequence: $\qquad$

Your message: $\qquad$
Amino acid (3 letter): $\qquad$
mRNA sequence: $\qquad$
DNA Sequence: $\qquad$
